

Git Hand-On 01: Setup Git and Add a File

Objectives

- Become familiar with basic Git commands such as `git init`, `git status`, `git add`, `git commit`, `git push`, and `git pull`.

What You Will Learn

- Set up Git configuration on your machine.
- Integrate Notepad++ as the default editor for Git.
- Add a file to a local Git repository and push it to a remote repository.

Prerequisites

- Install the Git Bash client.
- Create a GitHub or GitLab account.

Steps

1. Configure Git

Run the following commands in Git Bash:

```
git config --global user.name "Your Name"  
git config --global user.email "your.email@example.com"
```

Verify the configuration:

```
git config --list
```

2. Set Notepad++ as the default editor

If Notepad++ is installed, add its path to the system environment variables.

Then test it from Git Bash:

```
notepad++
```

Set Git to use it as the default editor:

```
git config --global core.editor "notepad++"
```

3. Create a repository

```
mkdir GitDemo  
cd GitDemo  
git init
```

Verify the repository:

```
ls -la
```

4. Create a file and track it

```
echo "Welcome to Git Hands-On" > welcome.txt
cat welcome.txt
git status
git add welcome.txt
git commit -m "Add welcome file"
```

5. Connect to a remote repository

Create a remote repository named `GitDemo` on GitLab or GitHub.

Then link it:

```
git remote add origin <repository-url>
git pull origin master
git push origin master
```

Summary

You created a local Git repository, committed a file, and pushed it to a remote repository.
